

# Hashing

11/10

## Universal hash function family

$$m, n \in \mathbb{Z}^+$$

$H$  is set of hash function  $\ni$  for random  $h \in H$  where  $h: \{0,1\}^n \rightarrow \{0,1\}^m$

$$\Pr(h(x) = h(y)) \leq \frac{1}{m}$$

Example:  $h_{k,q}(x) = ((kx + q) \bmod p) \bmod m$

w/  $k, q \in \mathbb{Z}_p$ ,  $k \neq 0$   
 $p$  prime  $\geq m$

(Note also common

$$(kx \bmod p) \bmod m$$

... not universal but collision prob is  $\frac{2}{m}$  in expectation)

## Non-Cryptographic hash function

No need to defend against collision resistance

Goal:

- fast to compute
- low probability of collisions

Eg

- FNV
- MurmurHash
- City & Farm Hash

Dictionary data structure  
of  $m$  buckets labeled  $\{0, \dots, m-1\}$

For table of  $m$  buckets  
w/  $n$  used keys

Load factor, denoted  $\alpha$ , is defined as  
$$\alpha = \frac{n}{m}$$

Some props

- $\alpha \in [0, 1]$
- $\alpha$  close to 1 high prob of collisions
- $\alpha$  close to 0 low prob of collisions

Handling collisions

- Closed addressing: 2<sup>nd</sup> ary data structure for elements w/ collision
- Open addressing: store in position that differs from preferred hash

Eg: Linear probing  
Cuckoo hashing

Linear Probing

- Store bins in circular buffer

Insert elt  $a$

- $x = \text{hash}(a)$
- if  $x$  is empty insert  $a$  into bucket  $x$   
else insert  $a$  into first bucket after  $x$  that is empty

Example insert green w/  $\text{hash}(\text{green}) = 5$   
insert white w/  $\text{hash}(\text{white}) = 5$

Result:

Lookup ( $a$ )

- $x = \text{hash}(a)$
- start at  $x$ , look ccw until find  $x$  or empty bin

## Cuckoo hashing

Idea: 2 candidate buckets determined by 2 hash functions  $h_1$  &  $h_2$

$$x_1 = h_1(a)$$

$$x_2 = h_2(a)$$

if  $x_1$  is empty insert in  $x_1$

$x_2$  is empty insert into  $x_2$

lse randomly pick  $x_1$  or  $x_2$  (call  $X$ )

move elt from  $X$  to alt bucket

repeat until alt bucket is found (or max # of iters ... considered full)

0	1	2	3	4	5	6	7	8	9	10	11

$$h_1(\text{red}) = 0$$

$$h_2(\text{red}) = 8$$

0	1	2	3	4	5	6	7	8	9	10	11
red											

$$h_1(\text{black}) = 6$$

$$h_2(\text{black}) = 0$$

0	1	2	3	4	5	6	7	8	9	10	11
red						black					

$$h_1(\text{silver}) = 5$$

$$h_2(\text{silver}) = 0$$

0	1	2	3	4	5	6	7	8	9	10	11
red					silver	black					

$$h_1(\text{white}) = 5$$

$$h_2(\text{white}) = 6$$

0	1	2	3	4	5	6	7	8	9	10	11
silver red					white silver	black		red			

lookup  $(a)$

-check  $h_1(a)$  and  $h_2(a)$

ext time: Set membership
